Measuring wheels

Description

When selecting a measuring wheel the kind of material to be measured has to be taken into consideration prior to any decision on wheel surface respectively cover lining. The wheel circumference depends on the space available as well as on the size of counter or encoder. The smaller the measuring wheel, the more force required at the wheel circumference and consequently the higher the risk of slippage and incorrect measuring results. Also the width of the measuring wheel has an impact on the result.

Appropriate material to be measured

Recommendend Surface	Suitable material
Hytrell grooved	Plastic, painted material, paper, Cardboard, wood, metal, textiles
Hytrell smooth	Plastic, painted material, paper, Cardboard, wood, metal, textiles
Cross knurl	Cardboard, wood, (textiles)
Knopped rubber	Textiles, cloth
Polyurethan smooth	Plastic, painted material, paper, Cardboard, wood, metal, wire

Measuring accuracy

Precise measuring results of a meter counter with measuring wheel depend on:

- Kind of measured material
- Contact angle
- Torque of counter or encoder
- Feeding speed
- Strain of measured material
- Surface roughness
- Contact pressure of material against measuring wheel
- Elasticity of measured material
- Diametrical tolerance of the measuring wheel
